Faculty of Economics, RUDN University

Abstract
In modern conditions of globalization, the quality of static data of foreign economic relations of the country plays an important role in decision-making about the foreign economic sphere of the country. This is without their quality leading to wrong static analysis of the indicators of foreign economic relations and methods of evaluation. As a result, it is impossible for correct decision not to be made by the government. Also, there are questions about what are the important priorities in the development of foreign economic relations of the country. According to the analysis of static indicators of foreign economic relations of Syria before and during the crisis, we noted that there was a deterioration of all indicators of foreign economic relations due to armed conflict. This includes the increase in the external debt 2.75 times in 2014 compared with the period before the crisis, the decline in exports and imports, and the improvement of e-government. In addition, work without high-quality cannot control foreign trade transactions.

Keywords: External economic relations, foreign trade, economic sanctions, exports, imports, the financial crisis, globalization

Introduction
In evaluating foreign economic relations, the author suggested the use of economic indicators on the basis where it became possible to reason the foreign economic policy of Syria. It is a detailed multi-criteria analysis which uses a reliable and qualitative data. However, it is able to display real situation of foreign economic relations and the prospects of their development and strengthening (Figure 1).
Consequently, economic openness gives the country an advantage in the development of foreign trade activities. Also, economic sanctions are barriers that limit the desire for openness. In order to assess the country's participation in the international division of labor in every way, the World Bank recommended the use of the indicators of quotas. The indicators of quotas can be defined as the ratio (in %) of exports, import, and external trade to GDP. However, those indicators do not reflect the differences between the economies of developed and developing countries according to
their level of economic development. Also, they do not include other forms of foreign economic relations (investment, financial, etc.).

Therefore, the following indicators are recommended for assessing the effectiveness of foreign economic relations at work (Table 1).

Table 1. Indicators for assessing the efficiency of foreign economic relations for developed and developing countries (%)

<table>
<thead>
<tr>
<th>Indicator</th>
<th>Formula</th>
<th>For developed countries</th>
<th>For developing countries</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>( \frac{E}{I} (1) )</td>
<td>( \geq 100% )</td>
<td>( \geq 100% )</td>
</tr>
<tr>
<td>B</td>
<td>( \frac{\text{FDI}}{\text{GDP}} (2) )</td>
<td>( \geq 15% )</td>
<td>( \geq 10% )</td>
</tr>
<tr>
<td>I</td>
<td>( \frac{\text{GDP}}{\text{ED}} (3) )</td>
<td>( \geq 113% )</td>
<td>( \geq 170% )</td>
</tr>
</tbody>
</table>

A - Coverage ratio of imports by exports %;
B - The degree of participation of foreign direct investment to GDP %;
I - Coverage ratio of External debt by gross domestic product %;
E: Exports billion dollars U.S.;
I: The volume of imports billion U.S.;
FDI: Foreign direct investment billion dollars U.S.;
GDP: Gross Domestic Product (GDP) billion dollars U.S.;
ED: Billion external debt U.S. $.

Furthermore, we can build the following equation on the basis of Table 1. Therefore, the synthesis of performance is given as:

\[
\text{Y\_COFER} = A \times \beta \times I \times 100\% = \frac{E}{I} \times \frac{\text{FDI}}{\text{GDP}} \times \frac{\text{GDP}}{\text{ED}} \times 100\% \geq 17\%^{18}
\]

\( \text{Y\_COFER} \) - Coefficient of the efficiency of foreign economic relations of the country [6, page. 18]

The next step will identify the main reasons for ineffective implementation of Syrian economic relations before and during the crisis.

Analysis Indicators of Macroeconomics and External Economic Relationship of Syria

The investigation of the influence of socio-economic crisis is reflected in the comparative analysis of foreign macroeconomic indicators before and during the crisis (Table 2).

Table 2. The most important macroeconomic indicators of the Syrian economy in the period 2000 – 2014

\(^{18}\) Calculated by the Author
Comparative analysis of macroeconomic indicators Syria showed a significant reduction of economic indicators during the crisis. Thus, GDP declined by 2.6 times, GDP per capita - 3.4 times, and unemployment rate rose to 57.7%. Budget deficit to GDP ratio increased to - 12.1%. In addition, there was a recession as a result of the crisis.

The most important indicators of foreign economic relations is an indicator of openness (export quotas, import quotas), as well as indicators of external debt and foreign investment (Table 3).

Source: Calculated by the author based on UN data, world factbook CIA USA, GWB, Syrian Centre of Statistics, Syrian Investment Agency SIA, SCPR - Syrian Center for Policy Research
Analysis of macroeconomic indicators shows a direct relationship between the decline in GDP and the indicators that characterizes the openness of the Syrian economy. Therefore, a decrease in GDP of export quota was reduced to 5.7%, the import quota to 19.6%, the external debt of Syria increased to $11 billion, and its share in GDP rose up to 50.4%. On the other hand, the decline of economic openness indicators data does not determine the overall degree of efficiency of the foreign economic relations of the country.

When evaluating the foreign economic relations of Syria, the author proposes to characterize the efficiency of external economic links (EEL) in the calculation of the indicators.

However, the calculation of the rate of the efficiency of foreign economic relations of Syria, during the 2000 - 2010 biennium, show a gradual improvement through the action of the following factors:

- After a change of government in 2000, the new government began the process of economic transition from a closed economy to an open type;
- The Government's priorities were aimed at reducing the external debt, as well as attracting foreign investments;
- The volume of domestic production increased, while import coverage ratio of exports and became positive (greater than 100%).

As a result, the management of foreign economic activity in Syria during the analyzed period was effective as the external economic links (EEL) efficiency ratio (over 17%) (Graph 1).

![Graph 1. Dynamics of efficiency ratio of Syrian Foreign Economic Relations (YEEL) in the period 2000 - 2014](image)

Source: Calculated on the basis of the author of the application of formulas (4) and a data in Table 3

The graph 1 defined the boundaries of the zone by characterizing the efficiency of foreign economic relations of Syria. During the period of social and economic crisis, the ratio below 17% is mainly due to a sharp decline in output (GDP), import and export coverage ratio (below 100%), and an increase in external debt. In 2013, the efficiency ratio was more than 17% increase in its impact factor based on the growth of FDI to GDP. This is
mainly due to the increase in foreign trade activities with SoyuzNefteGaz and other Russian companies in the field of oil production.

Consequently, this was performed on the basis of a comprehensive analysis of inter-related macroeconomic and external economic indicators identified in priority areas. Thus, this helps in the development of the foreign economic relations of Syria in conditions of instability.

In the course of the study, author disclosed institutional and legal factors which are influencing the conduct of the state's foreign economic policy. However, such factors include the lack of a permanent state of control over the adoption and enforcement of laws that is regulating the external economic links (EEL).

*Forecast Indicators of External Economic Relationships of Syria*

In this paper, the author proposes to use the short-term model (e.g., Brown model) to predict the development of various trends in foreign trade situation in Syria.

To implement the preferred direction of applied statistical research in the thesis, the following advanced scorecard was used:

**U1:** The export quota (volume of exports / GDP (%))
**U2:** Import quota (imports / GDP (%));
**X1:** Foreign direct investment to GDP (%);
**X2:** The unemployment rate (%);
**X3:** US dollars on the world price of oil;
**X4:** The budget deficit to GDP ratio (%);
**X5:** The external debt to GDP ratio (%);
**X6:** The level of economic growth (%).

To export quotas, calculated significance level P-value for the X2, X5 <0.05 (a measure of the significance of F in the ANOVA table as \(F_{\text{tab}} = 2.79\) <\(F_{\text{ex.}} = 19.18\) confirms the importance of R2.

To import quota, U2 significance P-value for the X1, X6, close to 0.05 (the index value of F in the ANOVA table is expressed as \(F_{\text{tab}} = 2.79\) <\(F_{\text{ex.}} = 7.18\)).

Using regression analysis, the inclusion and exclusion of variables obtained the following regression equation of exports and import quotas.

\[ Y_1 = 33.6 - 0.6X_2 + 0.1X_5 \quad \ldots (5) \]

\[ Y_2 = 30.4 - 0.5X_1 + 0.8X_6 \quad \ldots \ldots (6) \]

Results of forecasting of Syrian export and import quotas in period 2015 - 2016 will be the following: (Count 5).
However, the confidence interval is an alleged export quotas in various stages:
In 2015, 16.39 % > Y1 > 0.008 % (graph 2A) 
In 2015, 30.61% > Y2 > 8.85% (graph. 2B) 
In 2016, 13.81 % > Y1 > 0.008 % (graph. 2A) 
In 2016, 29.15% > Y2 > 6.84% (graph. 2B)

According to the calculated data, the participation of Syria in the international division of labor will decline in 2015 and 2016. Due to the armed conflict, Syria has a closed type of economy.

Under certain conditions, the end of the armed conflict in Syria, the most important task is to restore the national economy. To do this, we must connect the Syrian economy into the world economy through the development plan for future economic development. When designing the development plan, it is advisable to use the adaptive model that gives the forecast in the short term. For example, F parameter characterizing the importance of the table Analysis of variance is in the following ratio: $F_{ex} = 8.86 > F_{im} = 4.09 > F_{tab.} = 2.79$. Also, $R$ squared = 0.87 for $y_1$, $y_2$ = 0.62. Based on this, we obtain the following equation:

$$Y_1 = 20.4 - 0.08x_1 + 0.01x_2 + 2 0.08 x_3 + 31.14x_4 + 0.03x_5 + 2.28x_6........(7)$$

$$Y_2 = 33.3 - 0.37x_1 - 0.24x_2 - 0.37 x_3 + 0.39 x_6..............................(8)$$

On this basis, the equation variables traced the opportunity to the Government of Syria to influence the resulting figures (export and import quotas) positively or negatively. For example, the Syrian government will be

---

able to influence the change of factors X1, X2, X3, X4, X5, and X6 (See Table 4). Therefore, the result will be as shown in Figure 3.

* Calculations based on Brown's model

**Foreign Economic Models of Syrian National Economic Recovery in the Post-war Period, Taking into Account its Features and Drawbacks**

At the end of the armed conflict in Syria, the government in the reconstruction phase proposes two possible directions for the funding of economic recovery: Western and Eastern models (See Table 5).
Table 5. The features and shortcomings of Western and Eastern models of funding the Syrian economy in the postwar period

<table>
<thead>

<td>Political and economic dependence on Western countries (as a result of globalization); Short-term investments; Coverage of external debt with interest.</td>
</tr>
</tbody>
</table>

Source: Compiled by the author

However, some features of the eastern model, despite the strategy being implemented slowly, require a large period of time to carry out economic plans. This is because the effectiveness of this model can manifest itself in the long run.

In the future, if the eastern countries are not possible to finance the processes of restoration of Syria's economy, the government will have to depend on western sources.

For the results of the Western model, strategic plans are implemented quickly (by a large amount of money). Also, they receive future benefits possible in the short term. However, in the future, there is a risk of becoming dependent on the West. Therefore, this requires the intervention of international lenders in the economic and political decisions of the country.
