

After reading the article entitled "Pantothenic Acid. An overview focused on the medical aspects" I am issuing the following comment.

In view of therapeutic use in pathologies such as hyperlipidemia or cystinosis, the authors make a specific revision in the current state of knowledge on the role of this vitamin. This article is interesting because in the scientific literature, there aren't many references about the use. The description of this vitamin metabolism as well as the schemas and tables that include possible to follow the description given. As for the medical application, the limited information is reflected in the reviewed articles. The call attention of the authors on the therapeutic use of pantothenic acid may influence other researchers to investigate this issue. My recommendation is to accept the paper. However, it requires revision in order to correct some grammatical od punctuation errors.
