

Dear Sir/Madam,

In my opinion, the manuscript entitled "The Evolution of Measurement Methods of Comparative Advantage and New Trends in Intra-Product International Specialization" is an accurate and objective assessment of the current scientific knowledge regarding the topic.

I base my opinion upon my personal knowledge of the topic and the thoroughness and breadth of the literature review contained in the paper itself. This paper reviewed cited references from scientific journals, books, proceedings, bulletins, trade journal articles and web sites that have been published, or are otherwise available in the public domain, within China and abroad; and, also contain the most recent to the most relevant older literature.

Moreover, this paper synthesizes the relevant scientific conclusions in a very concise and interpretable manner. In addition, I found this paper to be aseptically clean of opinion or conclusion of any proposed hypothesis. A new approach is proposed after synthesizing previous literature.

However, I view the absence of methodological innovation as a problem only for any future publication of this paper in a scientific journal.

Lastly, I highly recommend that this manuscript be shared with international trade agencies with regulatory responsibilities, not only the Chinese one, but also as a demonstration of the extensive information resources available for similar researches. May I recommend this paper to be published in your prestigious journal?
